Population-weighted annual $PM_{2.5}$ increment (μg m^{-3}, 0–10 km rings), 10 m stack — preset default is class D at 3.5 m s^{-1}

No combination reaches the 2024 NAAQS annual standard (9 μg/m³) on the increment alone; cells would be outlined if one did. The v3 centreline metric gave 1–15 μg/m³ at the same presets.
